Materials for the Three-Level Distribution Box

Overview

The three most popular materials used for Electrical Distribution Boxes are Thermoset Plastics such as Sheet Molding Compounds (SMC), Engineering Thermoplastics such as Polycarbonate (PC) and Acrylonitrile Styrene Acrylate (ASA) and Epoxy Coated Steel used to make Metallic Deep Drawn. The three most popular materials used for Electrical Distribution Boxes are Thermoset Plastics such as Sheet Molding Compounds (SMC), Engineering Thermoplastics such as Polycarbonate (PC) and Acrylonitrile Styrene Acrylate (ASA) and Epoxy Coated Steel used to make Metallic Deep Drawn. In a newly constructed residential area, a 10kV power line is introduced into the substation. After stepping down the voltage through the transformer's low-voltage side (0. 4kV), power distribution is achieved through three levels of distribution boxes: the main distribution board, secondary. Let's explore the essential material requirements that ensure these boxes are safe, reliable, and long-lasting. As for the equipment inside, there are certain differences: the first level distribution cabinet generally has isolation switches, circuit breakers, leakage protectors, etc. Underground main trunks are possible-even common in urban areas, but cost much more than overhead construction. Laterals can. The major requirements are as follows: 1) Flame retardant with Glow Wire Flammability Index at 960°C as per IEC 60695 to ensure that any flame outside the box cannot enter inside and damage equipment and also to prevent any flame within the box from spreading outside.
