

AOC optical module coupling

Overview

Active Optical Cables (AOCs) are high-speed interconnects that combine optical fiber with integrated transceiver modules at each end. An AOC resembles a standard cable assembly (e., QSFP or SFP form factor), but internally, it converts electrical data into laser light and back. There are various connection solutions available for switching networks, such as optical modules + optical fibers, Active Optical Cables (AOC), and Direct Attach Cables (DAC). DAC can be further categorized into active ACC, AEC, and passive DAC. So, what exactly are these solutions and how do they. This comparison focuses on three dominant choices— DAC/AOC pairings (Direct Attach Copper and Active Optical Cables) and Optiese modules (standalone transceivers + fiber)—to help architects pick the right solution for spine-leaf and rack-to-rack links.
