

Aggregation and Distribution PoE Switch

Overview

An edge aggregation switch for campus/industrial networks is built to deliver deterministic TSN forwarding with hardware PTP timestamps, while safely powering endpoints via PoE and keeping reliability high through closed-loop thermal and power telemetry. The three layers of a traditional three-layer network design are the core layer, aggregation layer, and access layer. 5G, and 10G speeds for flexible customization, ensuring optimal performance, compatibility, and scalability Flexible interface options like copper, fiber, and PoE ensure seamless integration and cost-effective deployment Supports stacking for easier management, improved redundancy. In such high-capacity ethernet networks, switches are crucial as they direct data and transmit signals to the addressed devices. Downstream devices link to both, spreading traffic and failing over instantly in the event of switch or fiber failure. Expand your access layer with UniFi Enterprise Campus switches.
