

# All optical modules

## Overview

An optical module usually consists of an optical transmitting device (TOSA, including a laser), an optical receiving device (ROSA, including a photodetector), functional circuits, main control circuit board (PCBA), housing and optical (electrical) interface and other components. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Optical modules are essential components in modern communication networks, enabling high-speed data transmission over fiber optic cables. As the demand for faster and more reliable internet and data services grows, understanding these devices becomes increasingly important. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. Enhanced SFP (eSFP) optical module: supports monitoring of voltage, temperature, bias current, transmit power, and receive power.
