

Cable tray installation in explosion-proof areas

Overview

Cable tray systems must comply with article 318 with respect to ampacity, grounding, fill, spacing and segregation of cable types. Cables must comply with their respective NEC articles and should be listed but in Division 2 locations it is not necessary that they be listed for. Cable Trays have been permitted in the hazardous (classified) locations in the National Electrical Code for Class I (flammable vapor and gases) since the 1978 NEC and have been used extensively in chemical plants, refineries, and other types of facilities. This article is about code requirements.

Abstract - This paper explores the various standards and requirements for the certification, selection, use, and installation of cables and cable glands used in explosive gas atmospheres throughout the world. Chemical plants have risks like explosive gases, dusts, or vapors. Cofer Technology Center, one of the world's leading UL certified wire and cable research centers, Halo-Flex™ TC-ER-HL is an ideal, flexible power cabling. The information provided in this paper is an interpretation of the NEC and how it applies to cable types in a hazardous location.
