

Cables getting hot in cable trays

Overview

Size cables appropriately: Match or exceed expected load; add breakers or fuses.
Ensure strong connections: Tighten firmly, remove corrosion, use anti-oxidation seals.
Are you worried about your cables getting too hot?

Do you wonder if poor airflow in your cable trays could be causing problems?

Many modern buildings rely on cable trays to carry a lot of power and data lines. But with more and more cables and longer use, cables getting too hot is a big issue. It is a powerful tool for maintenance of critical power infrastructure. Reduce bundling heat: Separate conductors to. Eddy currents are circular electric currents induced within conductors by a changing magnetic field. Unlike cables installed in open air or conduit, cables placed in cable trays experience different heat. Cable support systems maintain proper spacing in an efficient way and do not expose wiring to direct sources of heat, extending the lifespan of its insulation.
