

Can fiber optic pigtails be buried inside walls

Overview

The short answer, based on general industry standards and the National Electrical Code (NEC), is that fiber optic cable is typically buried between 24 inches (60 cm) and 30 inches (76 cm) deep. However, simply hitting this depth isn't enough to guarantee your network survives. Underground fiber cables are generally pulled within a conduit that is buried underground, usually 1 to 2 meters deep, to reduce the possibility of being dug up. Lubricants are added to the outdoor cable design to reduce friction on high-pulling tension. While burying is common for durability, aerial deployment and even indoor use are viable, offering flexibility based on your specific needs and environment. Explore the diverse methods of fiber optic deployment. Why Bury Fiber. Armored Cables: Often buried at 1. These operations require no additional prime moves and cover following permanent grading of the road.
