

# Computer Room Cold Aisle Enclosure System

## Overview

Cold aisle containment systems use doors at aisle ends, ceiling panels or lids above racks, and structural frames to create enclosed zones where cold supply air flows directly to IT equipment intakes. In recent years, there has been no greater. An aisle containment system is a simple way to improve cooling efficiency in hot aisle/cold aisle rack configurations. Essentially creating a room within the aisle, the system helps keep hot and cold air separated to make existing air conditioning systems in data center and edge-of-network. Tate's Cold Aisle Containment (CAC) system efficiently captures cold air from the CRAH or CRAC unit via an underfloor plenum, ensuring the I. T equipment is kept at an effective temperature. When implemented correctly, they improve efficiency, reduce energy consumption, extend equipment life, and enhance overall reliability. This method raises the temperature of the air returning to a Computer Room Air Conditioner (CRAC) unit, which allows the unit to operate more efficiently.
