

# Computer room cold joint

## Overview

Cold Joint is a fault that occurs in soldered connections when the solder does not fully melt or bond properly to the components or circuit board. When you turn it on, the circuit board gets much hotter. They often look harmless, but can cause intermittent failures, unexpected resistance spikes, and field returns long after a product has passed initial testing. Unlike traditional heat-shrink systems, cold shrink accessories use pre-expanded silicone rubber technology that contracts tightly. Was wondering how cold is too cold to store computers, laptops, hard drives and such while trying to avoid damage?

The reason I ask is because I have a laptop and some other components sitting in a cold room that last I checked was 6 degrees celsius. Unfortunately it's the only place they can be. When a cold solder joint appears on a PCB, it might not fail immediately.
