

Construction Process of Relocation of Communication Optical Cables

Overview

Fibre optic cable relocation involves moving existing fibre optic installations to a new location. This process demands careful planning to maintain service continuity and optimal performance. 1 How to Relocate Fiber. There are two main types of cores employed in Fiber optics: a) Glass (Silica Core): These glass Fibers are composed of high-purity silica glass (SiO_2), the type used in most telecommunications and internet connections. It enables data transmission over hundreds of kilometres with minimal signal. Wireless communication, whether based on ultrasound, radio frequencies like Bluetooth or Wi-Fi, or optical methods such as infrared, offers the advantage of cable-free deployment. These systems can support high-speed data transfer when using high-frequency carriers such as microwaves or lasers.
