

# Direct Burial Process of Outdoor Optical Cable

## Overview

Cables are laid in a built trough made from concrete, stone or metallic sections, then covered and sealed. This method offers very high security and mechanical protection. Small-diameter micro-duct bundles are installed first. Installing fiber underground is one of the most durable ways to protect a network's backbone — when it's done right. But because the cable sits in soil exposed to. In the absence of duct infrastructure, cables can be buried directly into the ground in a trench or using a vibratory plow. Visit all our outdoor cables here. Note that Recommendation ITU-T L. It is required to have the performance of resisting external mechanical damage and the performance of. A practical, engineering-focused guide to planning and installing underground fiber optic cables with the right cable structure, trench design and protection level for long-life, low-risk networks. Match trench method with the correct underground fiber structure (GYTS, GYTA53, GYTY53, micro-duct). HDPE and PVC conduits help stabilize the cable environment, reduce.
