

Explosion-proof distribution box sealing components

Overview

The main structure of an explosion-proof electrical box includes the housing, cover, flameproof joints, sealing rings, cable entries, and internal component mounting brackets. From its global facilities ABB manufactures a wide range of ATEX, IECEx, UL, CSA approved electrical products for hazardous area applications. We understand the critical role these explosion-proof electrical fittings play in. For decades, the only explosion protection technology available in North America was the cast metal enclosure systems designed for Class I, Division 1 environments, also known as NEMA 7 explosionproof enclosures. Today, more than 3/4 of hazardous location installations are done in Class I, Division. Encapsulation is an alternate protection method where the electrical components are sealed to prevent contact with the explosive atmosphere. Encapsulation essentially creates a protective “shell” around the components by fully enclosing them in a compound or another non-metallic enclosure with. Henkel's polyurethane or silicone sealing foams protect the electronics in control cabinets and electrical distribution boxes against external influences, such as moisture and dust, which can cause against corrosion and contamination. Common protection methods include: These principles are.
