

# FC Fiber Optic Storage Array

## Overview

Fibre Channel (FC) technology has long been the foundation of high-speed, reliable storage area networks (SANs) in enterprise environments. Known for its ultra-low latency, lossless transmission, and strong security, FC enables efficient and stable communication between servers. A Fiber Channel SFP is a specialized optical transceiver designed exclusively for Fiber Channel (FC) networks, enabling high-speed, low-latency, and lossless data transmission in Storage Area Network (SAN) environments. The structure of the SAN allows any server to connect to any storage array so that the server can directly access the data it needs no matter. This connector is often used with Fibre Channel patch panels. Hubs physically connect nodes in a logical loop or a physical star topology.
