

Fiber drawing process of optical cable preform

Overview

Fiber is drawn vertically, with the preform at the top of the tower and the wind-up reels at the bottom. A multi-story tower allows the fiber to cool off before the coating is applied. In this guide, we break down the two core stages of optical fiber manufacturing: preform production (shaping the precursor material) and fiber drawing (transforming the preform into thin, usable fiber). We'll also explore advanced techniques, quality control measures, and how modern innovations are. It touches on those factors which can influence the stability and control of the process. Although the experiments and discussion are exclusively concerned with high temperature drawing of cylindrical glass fibers from preforms, some of the characteristics of this technique, and certain aspects. This step elongates a thick, solid rod into a flexible, hair-thin filament at high speeds.
