

Headlight high beam module malfunction

Overview

BCM or controlled-module faults that require programming or module replacement. Anytime you're uncomfortable working near airbags or performing electrical diagnostics. Verify: are both lows out or just one?

Swap in a known good bulb or test filament continuity. When your low beams refuse to illuminate while the high beams blast on like nothing's wrong, it's confusing and unsafe. This guide walks you through why it happens, how to diagnose it. It can be a bit tricky when your car's regular headlights don't turn on, but the bright high beams work just fine. Most headlight failures stem from burned-out bulbs or corroded sockets, but when both headlights malfunction. Was working perfectly fine yesterday as I was using Active High Beam Assist (the one where it automatically disables certain lights so it doesn't blind the oncoming driver). Activating High Beam - shows one of the little matrix LED on driver's side is not working.
