

High-speed optical-electrical connection with low loss in operator backbone network

Overview

High-speed data transmission is the lifeblood of backbone networks. Optical Transceivers such as QSFP28, QSFP-DD, and OSFP enable switches and routers to convert electrical signals into optical signals, which can travel through DWDM or OTN fibers with minimal signal loss. Evolving towards the 2030 optical communications network system and architecture is a key issue facing the optical communications industry and requires viable technical options for building future-oriented and novel optical communications network systems. Optical networks form infrastructure that. Backbone networks form the foundation of modern communication, linking cities, countries, and even continents through high-capacity fiber optic cables. It serves as the primary pathway for data transmission, linking critical infrastructure such as servers, switches, and data centers. At its core. While copper cabling still offers cost and reliability advantages for short-distance connections, it faces the dual challenges of speed bottlenecks and cabling complexity in high-bandwidth, long-distance, and high-energy-efficiency scenarios. To overcome these limitations, a new generation of.
