

How is the FBT coupler monitored

Overview

At the heart of this process lies the FBT machine—a precision instrument combining thermal engineering, mechanical alignment, and real-time monitoring. Fused Biconic Taper (FBT) coupler, also be called FBT splitter, based on the traditional technology, it is to bundle to-gether two or more optical fibers, and then pull the cone machine melt stretching, and real-time monitoring the change of the ratio, spectral ratio requirements after melt. Compared with PLC Splitter, FBT SPLITTER COUPLER has more advantages. It is not only low in cost, but also supports different energy-wind-solar ratios. At the same time, FBT SPLITTER COUPLER can be used in modular monitoring terminals and can play an excellent role in EDFA modules. Think of it like a traffic controller for light. It can take one stream of light and divide it into two (or more) separate streams, or it can take multiple streams and merge them into one. This ability to. FBT, or Fused Biconic Taper, couplers are optical devices designed to split or combine optical signals in fiber optic systems.
