

How many VLANs can a core switch support

Overview

A switch supports a maximum of 4096 VLANs, among which VLANs 0 and 4095 are reserved for system use, and VLAN 1 is the default VLAN. Therefore, you can only create VLANs 2 to 4094. You can repeat the vlan command multiple times. The interviewer asked me, "What is the maximum number of vlans does a switch supports" I said "A switch supports 1001 vlans and in extended vtp mode it supports upto 4000" then he asked "What if I have 5000 users in lan and I want to assign a vlan to each individual user then what would you do. The factory default number of VLANs is 256. The maximum VLAN values for the switch documented in this guide are as follows: VLAN Virtual. Configuring a switch to support multiple VLANs isolates network traffic, improving security and performance. we got switches using extended VLAN id 1000+ and would like to determine if STP (i got a mix of MST, PVST, RSTP), on the switch will support it. is there a unique/other command to check this aside from the usual 'show span'?

08-30-2021 03:11 AM Hello @johnlloyd_13, in my experience it is platform.
