

# How to coil the fiber optic box after fiber splicing

## Overview

Feed fibers will coil on the right of the tray and Distribution fibers will coil on the left. If splicing is to be done, route and coil the fiber as just explained, then after spliced, land the splice into the manifold in its correct position according to. After the communication engineers complete the optical fiber splicing in the fiber splice enclosure box, they need to coil the optical fibers one by one so that they cannot have excessive bending angles that will affect normal telecommunication. Unlike fiber connectors, which can be plugged and unplugged, splicing creates a fixed connection that is typically more stable and has lower insertion. In this guide, we cover the basics of fiber optic splicing, how to perform splicing using two different methods, and finally some best practices to perform good fiber splicing. What is Fiber Optic Splicing and Why is it Needed?

- #1. The Critical Role. Think of a fiber optic cable splice as the seamless stitching that keeps data flowing through the delicate threads of a network—like a master tailor joining fabric with precision.
