

How to test the speed of an optical module

Overview

Some of the common tests performed on optical transceiver modules include Loop back BER test, receiver sensitivity test, and Tx/Rx pair cross-test. Verification of the. However, over the years, this technology has been increasingly adopted for shorter reach applications, such as Data-Center Interconnect (DCI) and 5G/6G front/backhaul, to overcome physical limitations of Intensity-Modulation/Direct-Detect (IM/DD) as those applications demand higher throughput. The. In order to ensure the normal operation of the optical module, we need to test its performance and detect whether it meets the relevant standards and specifications. In its simplest form, a transceiver loop-back test can be performed with just an MPO patch cable, but in order to make the test far more comprehensive.
