

Huijue AI Intelligent Behavior Analysis Server

Overview

Based on the latest intelligent algorithm of deep learning, Behavior Analysis Server with a high-density GPU architecture supports the detection of behavior events in the perimeter, street, densely populated areas, indoor and other places, and triggers alarms in a timely. Based on the latest intelligent algorithm of deep learning, Behavior Analysis Server with a high-density GPU architecture supports the detection of behavior events in the perimeter, street, densely populated areas, indoor and other places, and triggers alarms in a timely. In an era where 2.5 quintillion bytes of behavioral data are generated daily, why do 80% of organizations struggle to convert behavioral insights into actionable strategies?

This paradox reveals critical gaps in modern analytics approaches. Recent Gartner studies show enterprises waste \$900 billion. Among the tools used in modern cybersecurity, AI-powered behavioral analysis — which leverages artificial intelligence to learn and predict adversarial behavior patterns — is becoming increasingly necessary. By augmenting traditional methods of detection with proactive, real-time detection of. Real-time detection and alarming of events such as getting up, key person getting up, climbing, absence or sleep on duty, abnormal number of people, overstaying, sudden change of sound intensity, regional overstaying, physical conflict, standing up, sitting, people counting or uniform detection. That's the job of an AI server—a custom-built system that keeps AI applications fast, scalable, and efficient. An AI server's architecture is all about. • Algorithms are used to configure parameters, and determine the detection range and optimal default values. • Only supports setting people as the default type for tripwire.
