

# Laser Lens Diode Relay

## Overview

A simple, all reflective, diffraction limited, color corrected, beam relay, capable of large scan angles and large deflecting mirrors. Two dimensional beam deflection is often required in medical laser scanning systems, laser marking systems and 3D printer. Most control boards offer the ability to attach a relay that can be triggered by firmware commands. If the firmware is compiled with standard parameters (or taken from LaserGRBL), there is one control command available. This command. Laser beam scanning is used most often by far in confocal microscopes. Commonly two linear galvo mirrors are. Optical relays, an integral component of various optical systems, play a crucial role when the user's proximity to the observed object is limited or when specific image transformations are required.
