

Link Aggregation of Industrial-Grade Switches

Overview

Link Aggregation Control Protocol (LACP, IEEE 802.3ad) allows multiple physical links between switches (or between a switch and a server/PLC) to be combined into one logical “aggregated” connection. December 2, 2025Updated on March 4, 2026 Network Redundancy and Link Aggregation are essential features of managed industrial switches eliminates this single point of failure by providing alternate communication paths that activate automatically when a fault occurs. This bundling increases the fail-safe performance and the bandwidth. In the case of. Link aggregation is a network technology that bundles multiple physical connections into a single logical link. This technology not only increases the total bandwidth available but also provides redundancy in the event of a physical link failure, thereby ensuring stable and continuous data.
