

Multi-layer meltblown fiber coiling method

Overview

We created a multilayer structure by placing a layer of solution-blowing nanofibres between melt-blown layers, and a mixed structure by simultaneous melt-blowing and solution-blowing. Both methods enable working with biodegradable polymers, so the resulting filter can also be. The present invention relates to a multilayer meltblown nonwoven fabric and a method of manufacturing the same. Here, we present a one-step melt-blown spinning process for the production of bicomponent core/sheath (BCS). The most commonly accepted and current definition for the melt-blown process is: 'a one-step process in which high-velocity air blows molten thermoplastic resin from an extruder die tip onto a conveyor or takeup screen to form a fine fibered self-bonded web'. Melt-blown microfibers generally have.
