

Optical Module Chip Structure

Overview

Optical module usually consists of a transmitter assembly (TOSA, containing a laser LD chip), a receiver assembly (ROSA, containing a photodetector PD chip), a driver circuit, an optoelectronic interface, a heat sink (some models), a housing, a pull ring and so on. Variations in the LD optical output can be checked by monitoring the current at the PD at the back face of the LD chip. When a current is passed. An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Optical modules are devices used to connect network devices, transmit and receive data between network devices, and can be used to convert optical and electrical signals.
