

# Optical module sends PRBs

## Overview

The Pseudo Random Binary Sequence (PRBS) feature enables data integrity checks between NCS 1014 trunk and client links without generating client traffic. A PRBS is a periodic, deterministic signal. It can be used to test the bit error performance of network links. To ensure that the traffic is error-free during link bring up without relying on the peer port, you must enable the PRBS feature on both the compute unit (CU) is composed by PRBS-31 generator & checker which sends & verifies 66b data at 25GbE rate. The PRBS checker compares the incoming 66b to a newly created 66b PRBS based on the previous data received. Bit-sequences like PRBS are used for testing transmission lines and transmission equipment because of their randomness. This lab covers three subjects that are used in several subsequent labs. In addition, we will conduct a statistical analysis of a PRBS sequence and the state changes.
