

Polarization-maintaining fiber optic patch cord fabrication

Overview

This article explores the design principles, applications, and selection criteria for PM fiber patchcords, offering insights into their role in modern optical systems. PM fiber patchcords are engineered to preserve the polarization state of light as it propagates through the fiber. Typical extinction ratios between 18 – 25dB maintain input. Thorlabs offers Polarization-Maintaining (PM) Single Mode Fiber Optic Patch Cables with a variety of connector options, including FC/PC, FC/APC, and hybrid FC/PC to FC/APC cables. The PM axis orientation is maintained by using male connectors with a positioning key and a bulkhead female receptacle with a tightly toleranced keyway, ensuring good repeatability in extinction. This high-performance Polarization Maintaining (PM) Fiber Patch Cord is engineered for precision-critical optical systems. PM fibers contain stress elements along their length that create two orthogonal axes with different indices of refraction.
