

Router is only used for fiber optic cable

Overview

A fiber router is designed to work specifically with fiber optic internet connections, providing faster and more reliable speeds compared to a normal router that typically works with traditional broadband connections. Many major ISPs, such as Verizon and Xfinity, offer fiber connections directly to your door, known as FttP or Fiber. Instead of a modem, fiber uses an optical network terminal (ONT). This device converts the light signals sent through the fiber cable into electrical signals your home's devices, like computers or gaming consoles, can understand. | Choosing a fiber-ready router. Unlike copper wires used in cable internet, fiber-optic cables consist of thin, glass fibers that transmit data as pulses of light, carrying information much faster with less interference.
