

Should the network cabinet socket be connected to the ground or neutral wire

Overview

According to NEC Article 250, both the neutral and ground wires must be connected only in the main panel or at the first service disconnect. They should never be connected together downstream of the service equipment, such as in subpanels or other parts of the circuits. Bootleg grounds are a BAD thing and very unsafe. Yikes, good find! This is most definitely the. In electrical systems, there is a clear distinction between the neutral wire (often called the N or zero line) and the ground wire (PE or protective earth). These two wires serve different purposes, and under no circumstances should they be shared or used interchangeably. This connection is not arbitrary but is a deliberate and necessary engineering. In the entire network cabling project, cabinet wiring is a meticulous task. The Importance of Standardized Cabinet Wiring.
