

Spacing between main distribution boxes

Overview

UL508A contains two important requirements to consider when applying power distribution blocks. Spacing of 1" through air, 2" over surface (at 600V) is required when used in a feeder circuit (that's everything ahead of or on the line side of the final branch circuit overcurrent). When applying Power Distribution Blocks (PDBs), there are various requirements that shall be satisfied, based upon different UL Standards, the NEC®, and the specific application. Some of the requirements and ratings include: voltage, continuous current, wire range (load and line side). The National Electrical Code (NEC) provides comprehensive safety standards for electrical installations, including requirements for electrical panels (main service panels and subpanels or breaker box). Whether you're upgrading your home's electrical service, designing a commercial facility, or managing an industrial power system, selecting and sizing the right. Good spacing helps each device work better and keeps your system safe. Place a Type 3 SPD close to. Electrical systems power our homes, offices, and industrial facilities, but behind every reliable electrical setup lies a crucial component that often goes unnoticed: the distribution box.
