

Testing Requirements for Second-Tier Optical Cables

Overview

The IEC has published a new standard for the testing of fibre optic cabling. IEC 61280-4-5 provides test methods to measure the attenuation of installed multimode and single-mode optical fibre cabling plant as well as the determination of their polarity and length. Fiber optic testing of a newly installed system not only verifies that the system meets its design requirements, but also creates a performance baseline for all future testing and troubleshooting of that system. The difference between the two power levels is the insertion loss which is displayed in dB (decibels). More basic and simple-to-use Fiber Troubleshooters provide similar visibility into a channel's connectivity by locating common causes of fiber failures such as high loss or reflectance incidents and fiber.
