

The aggregation layer requires a Layer 3 switch

Overview

An aggregation switch operates at Layer 2 or Layer 3 of the OSI model, depending on the configuration and topology of the network. They support link aggregation protocols such as Link Aggregation Control Protocol (LACP) and Static Link Aggregation, which allow multiple physical. Switch aggregation refers to the concept of consolidating multiple access layer switches into a single aggregation layer switch in a traditional three-tier network design. Its primary goal is to increase network scalability by providing a single place to interconnect multiple access switches and the core layer. They function as gateways to collect routing information in a point of delivery (PoD). Access layer: Access switches connect to PMs and VMs, add or remove virtual. This chapter covers the design recommendations for a data center design deployment consisting of a Cisco Nexus® 7000 Series Switch at the aggregation layer and a Cisco Nexus 5000 Series Switch at the access layer.
