

The relay protection framework structure includes

Overview

The circuit diagram of the protective relay is made up of current transformer primary windings, current transformer secondary windings, relay operating coils, circuit breakers, and the tripping circuit. The selection and applications of protective relays and their associated schemes shall achieve reliability, security, speed and properly coordinated. Meanwhile, protective devices have also gone through significant advancements from the electromechanical devices to the multifunctional, numerical. The components used in the power system are usually dimensioned to withstand a short circuit current for one or three seconds but power system stability during short circuit current may be endangered already after 200ms. A single-phase model of a simple power system is developed using the Power System Blockset. Circuit Breakers (CBs), as well as Voltage and Current. The rectangular devices are test connection blocks, used for testing and isolation of instrument transformer circuits. The device has a set pick-up value.
