

Transmission distance of 2-core single-mode fiber optic cable

Overview

Single-mode fiber (SMF) supports distances up to 40-100+ kilometers for standard applications, while multimode fiber (MMF) is typically limited to 300 meters to 2 kilometers. The actual distance depends on factors including fiber type, wavelength, network equipment, and signal. Fiber optic transmission distance varies based on fiber type, environmental conditions, and equipment selection. For example, a fiber optic cable with a distance of 1km supports a bandwidth of 500MHz, while a fiber optic cable with a distance of 2km can only support a bandwidth of 250MHz. Single mode fiber can transmit light signals over 100+ kilometers without amplification. In the complex landscape of fiber optic infrastructure, selecting the right cable type—single-mode (OS1/OS2) or multimode (OM1/OM2/OM3/OM4/OM5)—can define a network's speed, reach, and cost-effectiveness.
