

What are the components of a spectrometer

Overview

The main components include the light source, monochromator, sample holder, detector, and the output system, all of which work together to measure light across various wavelengths. While component types and devices vary from brand to brand, the core principle of how a spectrophotometer works stays largely the same. Listed below are some of the key components that make measuring transmittance possible.

Figure 1: Components of a spectrophotometer: Light emitted from the source.

Internal structure of a grating spectrometer: Light comes from left side and diffracts on the upper middle reflective grating. It typically emits light across a. Two kinds of lamps, a Deuterium for measurement in the ultraviolet range and a tungsten lamp for measurement in the visible and near-infrared ranges, are used as the light sources of a spectrophotometer.

How Does a Spectrometer Work? Principles Explained

Entrance SlitDiffraction Grating Or PrismDetectorRouting OpticsHigher Order FiltersThe optical detector records the intensity of the light that reaches it as a function of its wavelength. Spectrometer detectors consist of a row of light sensitive pixels, each of which corresponds to a particular wavelength. Each pixel will generate an electrical signal of intensity proportional to how much light falls on it. Charged-coupled device...See more on ossila Chemistry LibreTexts

An optical spectrometer (spectrophotometer, spectrograph or spectroscope) is an instrument used to measure properties of light over a specific portion of the electromagnetic spectrum, typically used in spectroscopic analysis to identify materials. The variable measured is most often the irradiance of the light but could also, for instance, be the polarization state. The independent variable is usually the wavelength of
