

What are the functions of the 8 cores in an optical fiber cable

Overview

An 8-core optical cable consists of eight individual fibers within a single cable jacket. "The core of a fiber optic cable is the central transparent portion of the optical fiber made up of glass or plastic which actually receives the light signals for data transmission purposes. Professionals in telecommunications, data centers, and network infrastructure must understand the core functions and why they are fundamental to their fiber optic. A fiber optic cable consists of five basic components: the core, the cladding, the coating, the strengthening fibers, and the cable jacket. Structure The structure of 8 Cores is. The number of optical cores in an optical fiber is the total number of equipment interfaces multiplied by 2, plus 10% to 20% of the spare quantity, and if the communication mode of the equipment has serial communication and equipment multiplexing, you can reduce the number of cores.
