

What is HA on network security devices

Overview

A High Availability Firewall (often referred to as an HA Unit, HA Appliance, or HA Device), is a type of Firewall intended to be used as a back-up for an identical Standalone Firewall. Once it is associated to another device on www.com and properly configured, the HA device will enter a. High availability (HA) is a deployment in which two firewalls are placed in a group or up to 16 firewalls are placed in an HA cluster and their configuration is synchronized to prevent a single point of failure on your network. HA firewalls can maximize the availability of critical services using various clustering modes, such as active/active vs. This contrasts with single firewall setups that can lead to lengthy downtime. Cisco NX-OS network-level HA is optimized by tools and functionality that provide failovers and fallbacks transparently and quickly. The goal of an HA setup is to deliver a consistent, agreed-upon level of performance by.
