

What is an ALS optical module

Overview

The automatic laser shutdown (ALS) function automatically shuts down the lasers of optical ports in the transmit direction when a fault occurs on the client-side or WDM-side link. If the optical module can receive light, it will always emit light. Specifically: when the optical fiber is broken and the maintenance personnel are splicing the fiber, ALS is selected, and the optical module. Industry's broadest portfolio of high-performance and high-sensitivity digital discrete and integrated module optical sensors including ambient light sensors, RGB and XYZ color sensors, and spectral sensors. The spectral response of the sensor tightly matches the photopic response of the human eye and includes significant infrared rejection. The OPT3001 is a single-chip lux meter, measuring the intensity of light as visible by the. Ambient light sensors are also called illuminance or illumination sensors, optical sensors, brightness sensors or simply light sensors.
