

What is the appropriate curing temperature for fiber optic pigtails

Overview

The epoxy's temperature is influenced by the mass of the connector, so it may take 2 or 3 minutes for the epoxy's internal temperature to reach 100 degrees C. Your total curing time maybe 12 minutes, not 10. A fiber optic pigtail is a short length of optical fiber —typically 0. The connector end is polished and tested under factory conditions, ensuring low insertion loss and high return loss. The bare fiber end. A fiber pigtail is typically a fiber optic cable with one end factory pre-terminated fiber connector and the other exposed fiber. Compared with quick termination or epoxy and polish connections placed on the field. Factories terminating fibers use heat-cured epoxies because they produce the best performing most reliable connectors.
