

What is the working principle of an automatic pigtail dispensing machine

Overview

The working principle of the automatic dispensing machine is: first, the liquid material is transported from the liquid storage tank or pressure barrel through the hose to the dispensing valve, and then the switch of the dispensing valve is controlled by air pressure or. The working principle of the automatic dispensing machine is: first, the liquid material is transported from the liquid storage tank or pressure barrel through the hose to the dispensing valve, and then the switch of the dispensing valve is controlled by air pressure or. Dispensing systems function according to two different physical principles: dispensing of liquid either takes place via an air cushion or by positive displacement. These two different dispensing principles are presented below taking piston stroke pipettes as an example. So you can know how each step works inside the machine. An automatic capsule filling equipment is made up of several functional units. Each unit performs one specific task and works. Automatic filling machines offer a solution, delivering precise, high-speed filling processes across industries. Servo motors provide higher torque, better repeatability (± 0.01). Multi-axis systems (3-axis, 4-axis, 5-axis) execute.
