

Where is the broadband optical splitter installed

Overview

When employing the first-level splitting method in a residential network, optical splitters offer flexibility for indoor or outdoor installation. Indoor options encompass locations like the community's central computer room, building's weak current well, or floor wiring box. They. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. Where splitters are placed in the network can make significant impacts on fiber counts, network cost and deployment time and operational steps, such as customer onboarding and maintenance. If you are familiar with FOA's other design materials, you know we don't give you formulas or outlines to follow.
